Subject:

rush seq search req

Hi Christina-

Please approve the following for a due amended:

STIC:

Please do a regular and interferences search of SEQ ID NO: 26 (full length) and an oligo search of 30 contiguous amino acids of SEQ ID NO: 26 for 08/741095

Thanks,

Elizabeth (Betsy) Kemmerer Art Unit 1646 308-2673 CM1-10B17 Mailbox: 10C01

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.

                     The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
                                                                                                                                                                        Baker
                                                                                                                                                                                    Sette
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    N-terminus of a mature human TANGO-69-receptor:IgG1 Fc fusion protein. The fusion protein was expressed in HEK 293° cells that had been transfected with a vector carrying a gene fusion composed of the human TANGO-69-receptor (sHVEM1, see AAX94195) coding sequence and DNA encoding the Fc domain of human IgG1. sHVEM1 (see also AAY79204) is a novel soluble form of membrane-bound herpesvirus entry
                                                                                                Disclosure;

                                                                                                                                                                                                                                         The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                    having a human major histocompatibility complex (MHC) Class I (also cknown as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes CHLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic T lymphocytes (CTLS) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) c.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or

The HCV polypeptides are particularly useful for stimulating cell-mediated immune responses, e.g. activating HCV-specific T cells. The fusion protein is useful for generating an immune response against HCV in a mammal, particularly a cytotoxic T lymphocyte (CTL) response for either therapeutic or prophylactic treatment against HCV infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   immunisation with plasmid or naked DNA encoding an NS3NS4NS5a fusion protein will activate CD8+ cells which recognise and lyse target cells displaying an NS5a epitope. The present sequence was useful in the production of the invention which includes fusion proteins comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents cytotoxic T lymphocyte epitopic peptide p214K9 which comes from hepatitis C virus NS5a protein (HCV-NS5a), this sequence was used in an experiment of the invention to show that

Baker DM,
                The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HIAD-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
                                                                                                                   WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epicope such as those given in AAJ00010-AAJ04121. These are derived from HCV HILDP binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               A new composition useful as a vaccines

                                                                                                                                                                                                                                     The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HIA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.

Baker DM,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sette A,
Baker DM,
                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ0010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.

Baker DM,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.

                                                                                                                                                                   AAJ03766;
                                                                                                                                                                                     AAJ03766 standard;
                                                                                                                                                                                                                                                                                                                                     The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epitope such as those given in AAJ00010-AAJ04121. These are derived from HCV HIA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                              A new composition useful as a vaccines against hepatitis C
                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2001-308046/32.

Baker DM,
                    The present invention describes a composition comprising a prepared hepatitis C virus (HCV) epicope such as those given in AAJ0010-AAJ04121. These are derived from HCV HLA-binding motifs. They are useful in vaccines for the prevention and treatment of HCV infection in humans. The present sequence is an epitope used in the disclosure of the invention.
                                                                                                                                                                       Sette
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   145 SPGQRV 150

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Q
                                                                                                                                                                                                            A composition (A) comprises at least a first dimerisation peptide (I) C comprising the sequence (SI) that is no more than 8 amino acids long, where the composition optionally comprises a second dimerisation peptide (C (II): NH2-X1-X2-X3-X4-X5-COOH (SI) where X1 to X4 = Ala, Val, Ile, Leu, Trp, Phe, Met, or Tyr, and X5 = Lys, Arg, Asp or Glu; CC NH2-X1-X2-X3-X4-X5-COOH (II). The compositions of the invention are cidsplayed intracellularly or extracellularly and are useful to identity comprises and molecules, and to modulate intracellular signalling C pathways. A library of constrained proteins may be evaluated in vivo for its bloactive potential. The invention can be used to access molecules cor targets within living cells, and then provide for the isolation of the constrained protein which has a phenotypic effect on the living cells. The methods are also useful to identify in vitro binding partners CC of the constrained protein. The compositions of the invention are useful CC as a scaffold for gene therapy and for potential use as a therapeutic negative constrained protein. The propositions of the invention are useful CC in physiological fluids. The present sequence is used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes peptides which have a moderate or high affinity for each other, when added as extensions to both the N-terminus and C-terminus of a protein, can be used to help fold the protein into a compact structure. This compact structure is more stable to proteases.
                                                                                                                                                            Sequence
                                                                                                                                                                                                in physiological fluids. The present sequence exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Disclosure; Page 18; 75pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel dimerization peptides which self-associate are used with other proteins to effect the formation of compact structures -

::
     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score

      Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Score
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        seq length:

FEBS Lett. 54:100-102(1975)
-i- FENCTION: MAIN TOXIN OF BEE VENOM WITH STRONG HEMOLYTIC ACTIVITY.
INTEGRATES INTO CELL MEMBRANES AND HAS MULTIPLE EFFECTS, PROBABLY AS A RESULT OF ITS INTERACTION WITH NEGATIVELY CHANGED PHOSPHOLIPIDS. IT INHIBITS WELL KNOWN TRANSPORT PUMPS SUCH AS THE NA(+)-K(+)-ATPASE AND THE H(+)-K(+)-ATPASE. INCREASES THE PERMEABILITY OF CELL MEMBRANES TO IONS, PARTICULARLY NA+ AND INDIRECTLY CA2+, BECAUSE OF THE NA(+)-CA(2+)-EXCHANGE.
